# CANNABIS vs. CANCER

## THE COVERT WAR

SHARON LETTS

Image: Sharon Letts

As detailed in my last article, a spiderweb-like mass found in my right breast during both a Mammogram and Ultra-Sound found me looking at a biopsy for possible Lobular Carcinoma.

In the past month pending the biopsy I began upping my ingesting of Cannabis in tinctures, oil, and raw leaves.

The morning of the biopsy I ingested a tablespoon of infused honey tincture, rather than the usual "Valium" needed for my "medical procedure phobias," as I'm replacing most everything I can these days with the green.

I was completely relaxed as the technician rolled the Ultra-Sound's magic wand around my breast, thinking to myself, "Wouldn't it be amazing if the minimal amount ingested was enough to make that spider-web disappear?" As I lay there further telling myself, "Too good to be true, not going to happen to me," the technician informs, "I can't seem to find it."

After looking at past and current views, the surgeon said, "We might not do this today."

To which I informed, "I've been ingesting raw Cannabis - that may be the reason," to which he asks if he can

do that therapy too.

Why is it that stoner jokes always come into play whether we are discussing medicine or not? As if getting high is the end-all, as I lay there with my boob exposed and jelled, facing the big "C."

But this is my moment to enlighten. I advise, no, ingesting of raw Cannabis will not get you high, and teased that it may not be the treatment for him, to which he was comically disappointed.

I then ask if he is aware of Cannabis as a treatment for Cancer, and he quickly says no, but continues to tell me he was part of a Cannabis experiment in medical school in the 1960s.

As he tells me about his experience with a Cannabis patient (I do not doubt), and he said he was so excited (intoxicated), he grabbed the ass of the patient and howls of laughter were heard, but I pressed.

There must have been a strong batch of say, to more chuckles. I then advise him of the practice of heating Cannabis for psychoactive effects (THC tetrahydrocannabinol), and that CBD Cannabinoid is a natural medicine that works without boobies promoting health and healing illness.

Mind you this is all taking place as I lay there boob exposed for all to see. He said there was to test Cannabis in treating cancer, and we all know now that turned out, right?

Stumped at the lack of mass, the good doctor wanted to go ahead with the procedure, "... as long as we are all here," he declared.

I took this as my chance to do a little trial myself and asked if we could postpone the procedure another month, while I continue with my own therapy. Thankfully, he agreed.

We don't know if Cannabis made a difference with the disappearance of the mass, we can only guess for lack of real research. But what else could have caused the mass to disappear?

As said in my initial essay, according to the Mayo Clinic's Web site, Hormone replacement (Estrogen/Progesterone)

is the only cause listed for Lobular Carcinoma, but my doctor advised that I had not been on the medications long enough to be the cause – less than three months.

As soon as I was informed of the need for a biopsy I made the decision to stop taking the Hormone replacement. This lasted two weeks, as I melted down emotionally (ongoing symptom of menopause), prompting my doctor to prescribe once more.

Could the two week lapse have caused the mass to go away? My doctor said it's not likely. Could it have been an error with both the mammogram and Ultra-Sound technician's findings? I can't answer this, as I saw the mass myself.

Or perhaps Cannabis cures Cancer? Sadly, we won't know until our own government either acknowledges the research done thus far, or helps its own by funding further trials at home.

Until then, it's up to us to use the plant as God (or Goddess) intended. I'm on my way into the kitchen now to make a Canna-smoothie, and take a dose of "Phoenix Tears," Rick Simpson's proclaimed cure for Cancer, handmade and gifted from a friend. <http://phoenixtears.ca/>

On the downside it's tough to take and sticks to my teeth. I'm finding myself day-dreaming of one day being able to open up a little, orange, plastic prescription container from our local pharmacy or collective and popping a highly concentrated Canna-pill into my mouth once a day to ward off the inevitable Cancer ravaging this country from its own poisons. Is that too much to ask?... **PART 3 NEXT ISSUE!**

**GATEWAY DRUG OR MIRACLE CURE? DEPENDS ON WHO YOU TALK TO, BUT ONE THING IS CLEAR — THE NEED TO INVEST IN UNBIASED RESEARCH HAS NEVER BEEN GREATER.**

Evidence suggests that global usage of marijuana is on the rise for both medicinal and recreational purposes (due in no small part to the willingness of people to admit to smoking it) but barely a day goes by without a new voice striding in to the debate to add its two cents. The apparent risks range from schizophrenia and obesity to heart disease and cancer yet the health benefits currently being suggested include a positive effect on dementia and, possibly, a cure for cancer as opposed to a cause. So who should you choose to believe?

## AT ITS BEST

Words and Images by Green Born Identity - G.B.I.

**MK-Ultra's strain naming goes back to a program of experimental trials with LSD conducted by the US government from the early 1950s until 1973 under the title of Project MKULTRA. It led to controversies due to the fact unwitting Americans and Canadians were used and exploited as test persons for this project. With T.H. Seeds' MK-Ultra it's a different approach, any willing growers and smokers can voluntarily take part in the grow and smoke experience provided by this award-winning strain so every ambitious cannabis aficionado can run his own private MK-Ultra experiment. But by the way... its heavily hypnotising mental effect may find you to grow it again and again...**

According to T.H. Seeds, MK-Ultra is blessed with "addictive qualities that cannot be underestimated" which is made possible by vast hypnotic indica power coming from the marijuana genes involved: G-13 was married to LA Confidential and O.G. Kush, to produce a plant with thick and tight buds heavily coated with resin glands and ripening within 8-9 weeks of flowering. MK-Ultra is furthermore characterised by a pine flavor that lingers on the palate for an age. She's expected to grow 100-120 cm tall and yield up to 350 grams/m<sup>2</sup>.

MK-Ultra received early honors when she was chosen as Best Indica at the 2003 High Times Cannabis Cup and a 2nd place was awarded in 2004. German grower Growolf felt highly attracted by MK's profile and decided to conduct a botanical and psycho-active MK-Ultra experiment using a pack of five feminised seeds. He sowed the seeds into Jiffy pots and they quickly sprouted, enjoying a good start placed in a Secret Jardin 1 m<sup>2</sup> grow box under a 250 Watts CFL at 18 hours of light per day. He planted the young seedlings into 11 litre pots filled with Bio Nova coco ground and after ten days moved them into his 6m<sup>2</sup> grow room equipped with 4x 600 Watts lamps (2x HPS, 2x MH / 4x HPS in the flowering stage) where a range of other more regular strains were already growing at a daily light cycle of 18 hours. The five MK-Ultra plants were adopting a very compact growth pattern; growing very uniformly with vigorous side branching, clearly pronouncing their share of sativa traits as well.

One week later Growolf induced flowering by switching the daily light cycle from 18/6 to 12/12. At that point in time the five plants measured 34-41 cm in height. They quickly responded to the reduced light cycle with all of them producing female pre-flowers one week after the switchover. During the first four

weeks of flowering they kept on stretching, increasing in height by about 10-12 cm every week. Also, in terms of flowering behavior, the five MK plants proved to be very homogeneous and they had produced lots of indica-style flower clusters along their main stems and side branches with resin production appearing vividly, so it all looked very promising. Bud formation became thick and tight in the following weeks of flowering and the plants were building quite impressive top colas and lots of excellent side buds with a high calyx-to-leaf ratio. They were increasingly oozing with resin, spreading a deliciously strong pine fuel odour, very much to the delight of Growolf.

After 57, 60 and 62 days of flowering the five plants had fully matured, perfectly in accordance with the flowering time of 8-9 weeks stated by T.H. Seeds. Growolf happily harvested his five marvellous MK-Ultra plants, the sticky buds of which had become resinous and super resinous in last weeks of flowering; these buds were coated by multiple silvery white layers of resin glands. The heavy, most intense pine fuel odour alone had an almost anaesthetic and addictive effect on Growolf and he just couldn't turn his nose away from those ripe fragrant buds; he was present in a sort of natural, hypnotic aromatherapy act.

At the end, the five plants had arrived at final heights of 76, 81, 89, 92 and 93 cm. When the MK harvest had been carefully dried, Growolf read a total yield of 286 grams from the scales i.e. the five plants had produced an average yield of almost 60 grams of superb MK nuggets per plant which he considered a very good outcome. In a future MK-Ultra grow he would leave the plants in the vegetative stage for 1-2 more weeks to obtain bigger plants and accordingly even higher yields.

Smoking the MK, in the form of a good fattie, quickly effected a mightily strong indica turn in Growolf's head. Indeed, he felt kind of hypnotised in no time and also paralysed. After a few tokes he was nailed into his couch, being dazed but not confused. His inner server was widely shutting down and, with his mouth wide open, he watched a football match on TV. This most heavy effect would last for almost two hours and only the thrilling qualities of that match kept him from falling asleep. MK-Ultra's taste was as delicious as expected - piney, sweet and with a long aftertaste.

**So, Growolf's own MK-Ultra experiment was a very positive one, yielding great results in any aspect - "This really is hypnotist marijuana at its best", he enthused.**
